

Enterprise Edition Features Explained

BizTalk Integration

Enable interaction with BizTalk Server 2006, through the Nintex Connected Framework. The action can send messages into a BizTalk orchestration and/or wait for a message from BizTalk. This action allows a workflow to interact with any external system that BizTalk interoperates with

Account Provisioning

Workflows actions support automated provisioning tasks such as: Adding and Removing users to AD Groups; Creating, Decommissioning and Updating AD Accounts; Provisioning Users on Exchange and Enabling LCS/OCS Accounts.

Submit to Record Center

Workflows can submit documents to SharePoint Server record center sites, allowing for workflows to help manage content development throughout their entire life cycle, all with an easy user interface and with minimal complexity exposed to users.

Excel Services

Excel worksheet models can be executed and used by workflows. Excel Services for Microsoft Office SharePoint Server 2007 can expose calculation models and spreadsheet data via a SOAP Web service. This workflow action makes it easy for users to provide inputs and read results from worksheets.

Search

Execute queries against Microsoft Office SharePoint Server's enterprise search engine and incorporate the results into workflows. This works with both full-text and property-based queries.

Business Data Catalog

Nintex Workflow 2007 can query the Business Data Catalog to retrieve data from line of business applications and external databases.

User Profiles and Audiences

Workflow actions support add/update/delete operations on the SharePoint Server User Profile Store, including properties, Member Group, and memberships. Audiences can be created, deleted, modified, and recalculated.

Enterprise Configuration

Nintex's two out of the box web parts, "My Workflow Tasks" and "Workflows I've Started" can be configured at a farm level allowing users to revert to one location to track workflows pertaining to them

Workflow Reporting

Workflow Statistics are available on each workflow providing a holistic view of workflow performance. This includes details on average run time, total runs, amount of workflows in progress, as well as user performance, making it a crucial feature to identify bottlenecks in business processes. Reporting capabilities are further extended through data driven and graphical web parts including reports like 'Average workflow completion time', 'standard variations', 'min and max completion times' and 'user response times'.
